Field of the Invention The present invention relates to an endoscope which is insertable into body cavities such as the stomach and the intestine for diagnosis and inspection. 2. Description of the Related Art Most of the conventional endoscopes used in the stomach are rigid endoscopes, in which the distal end portion of the insertion section is rigid, and the remainder of the insertion section including the flexible insertion section for inserting the endoscope into the body cavity is flexible. Further, in recent years, it has become desirable that the insertion section of the endoscope, including the insertion section which is insertable into the body cavity, be small in diameter. Recently, the flexible insertion section of the endoscope which is suitable for insertion into the body cavity has been developed, instead of the rigid insertion section. The distal end portion of the flexible insertion section includes a flexible distal end tube in order to ba244e880a
