The present invention relates generally to methods for reducing emission of sulfur oxides (SO_x) and nitrogen oxides (NO_x) and particularly to a method for reducing the emission of such oxides by oxidation of sulfur compounds in a combustion exhaust gas. As is well known, nitrogen oxides (NO_x) are naturally generated during combustion of a fossil fuel. It is known also that a substantial amount of SO_x (sulfur compounds) are produced as a by-product in such combustion. The emission of SO_x and NO_x is becoming a serious problem in such industries as coal-fired power plants and iron and steel works. Currently, there are numerous technologies available for the reduction of the emission of SO_x and NO_x, examples of which include wet, dry and semi-dry techniques. The wet techniques have only limited possibilities for reduction of the emission of SO_x and NO_x, and the dry techniques can only be used in environments wherein the temperature is low and the combustion gas is brought into contact with a catalyst disposed in a surface of an adsorption medium. The semi-dry technique cannot be readily applied for the entire spectrum of combustion gas conditions. The remaining techniques are limited to the use of various additives. Among these additives are: a) SO_x/NO_x catalysts containing vanadium, b) aqueous alkali solutions in some cases containing vanadium compounds, c) sulfur compounds and a chemical absorbent in other cases containing vanadium compounds, d) chemical absorbents in which SO_x/NO_x compounds are absorbed in a liquid phase and recovered by stripping a part of the process gas, and e) water in the form of steam. The SO_x/NO_x catalysts of a) and b) have received recent attention in the art. The catalyst of a) comprises a mixed oxide of vanadium and molybdenum as disclosed in published Japanese patent application No. SHO 53-98351 which is the catalyst containing a 0.05 to 5.0% by weight of vanadium. The catalyst of b) which is a liquid solution of ammonium sulfite or potassium sulfite has an SO_x/NO_x reduction capacity of 50 to 90% but has drawbacks in that it has a high

Download [Rupture of the aortic isthmus in a young woman]. Aortic dissection is responsible for more than 50% of all sudden deaths in young subjects, of which 5 to 10% are due to acute type A aortic dissection. The ascending aorta is the most common site of rupture of the aortic isthmus, often associated with severe aortic insufficiency and the distal arch and descending thoracic aorta are rarely involved. Aortic rupture may occur in patients with Marfan's syndrome or in the absence of any identifiable risk factor. It may occur in young subjects, usually in association with sudden syncope and aortic insufficiency. Clinical presentation and associated risk factors are similar in these two

different forms of dissection. Rupture of the aortic isthmus as the presenting feature of acute aortic dissection is rare and is usually associated with significant peripheral ischemia. Aortic rupture may occur before, during or shortly after surgical repair of aortic dissection and mortality is high (40%). The optimal time for the intervention is not clearly established. Since the benefits of immediate surgical repair of aortic dissection are well-established, it is now recommended that surgical repair should be carried out early during the same hospitalization of surgical repair of the dissection in patients with ascending aortic dissection.

Q: R

Programming - Add line break after each word

I have to write a program in R to produce text which appears like an article. It has to break each line at every word. How can I do this in R?

A: This can be achieved by using `cat` and `gsub`:

x Q: POST request is null I was doing a post request with `etrofit2`, and I set all the header

values, also I do validate request body,
