Q: Gradient of a function on Riemannian manifold Let (M, g) be a Riemannian manifold. Let h be an invertible affine function on TM , that is, $h(v_x, v_y) = h(x, y) \circ v_x$. Then the Hessian $g(X, Y)$ of h is just the Hessian of h with respect to the standard inner product. Note that h is invertible, so X and Y are always tangent vectors to TM and its dual tangent vectors X^\flat and Y^\flat are $X^\flat = h(Y) \circ v_y$, $Y^\flat = h(X) \circ v_x$ where $X = h(Y) \circ v_y$. Note that $(X^\flat)^\ast = Y^\flat$ since $X = h(Y) \circ v_y$. If we are given that h is a function of gradient $\text{grad } h$ with respect to g , i.e., $Dh = h \text{ grad } h$ or $Dh = h(\text{grad } h)$, then for each (x, y) $Dh(X^\flat, Y^\flat) = \text{grad } h(X, Y) = Xh(Y) + Yh(X) = g(X^\flat, Y^\flat)$. (This is why X^\flat and Y^\flat are dual.) I am wondering what is $Xh(Y)$ in terms of the Hessian $g(X, Y)$ and the Riemannian metric g . Is it $Xg(Y, Y)$? A: You have that for every vector fields X, Y in TM , $g(X, Y) = h(h^{-1}(X), h^{-1}(Y))$, $\text{grad } h = h \text{ grad } h = Dh$. Then, note that Dh
