## How To Download And Install Adobe Photoshop 8.0 Cs With Key

Q: How do you know where to go when a character is falling? How does a character determine how to move once in free fall? I have played in a lot of MMORPGs like WoW and the way I used to play would have been more along the lines of flinging the character in whatever direction they decided and letting the angle of the rocket launcher determine how much of a directional force they are putting behind the blast. In Diablo 3 I mostly play melee which means a lot of time is spent slashing at monsters that fall behind me. Since this is a question about gravity, I am also interested in the effects of gravity in other MMORPGs like NWN2, SWG, WoW and LotRO. A: From How Long Does It Take To Fall Off a Cliff?: The time a body spends in free fall is governed by its mass, its speed relative to the surrounding air, and the air density. The equation in use, at the time of writing this answer (2015), is:  $T_f = \sqrt{2 / c * m * g * \sqrt{(R/r)}}$  where the subscript f stands for free fall, T is the time since gravity started working, m is the mass, g is the acceleration of gravity, r is the radius, and c is the velocity of air (or whatever is going to be used to calculate the time - a constant value is added later). For characters, g is 0.05 and c is often specified as a constant value set by default. For most high-level content (shorter fall) this would be around 3, for most low-level content (longer fall) around 15. Once you calculate the time since gravity started working, you have to divide it by the time it takes for a body of the mass to fall to a height of radius (R). Air density is used to scale down the time, because air density depends on pressure, and pressure depends on the mass of the same volume of air. To calculate the time required since gravity started working, you multiply the square root of the product of the mass and gravitational acceleration of g, with the distance from the ground and the radius of the planet, then divide that by c (or the constant added to c). The formula can be simplified if you assume that the gravity the player is feeling is the result of the gravitational acceleration of the ground, which is a good approximation
