Integrating GPU using CUDA only when required I have a system that hosts multiple GPUs and it looks like my application will require most of the resources of the GPU. Is it safe to only use the GPU for my application and not for other tasks such as visualisation? A: It is safe to use the GPU exclusively. However there are two primary questions that need to be answered: Are the GPUs already allocated to another thread, process or other task? If so, are they going to work on the task you need? Is the GPU bound? If so, is it going to be busy doing other things or is it idle? If you have enough CPU to avoid using the GPU, just use the

CPU. If the other thread/process is going to work on the task you need, you will have to use the GPU if you need to update a visualisation or other data. If the GPU is idle, then you won't need to use it and just do all the CPU work.
