TIP: If you want to test a new computer, simply use Photoshop before you get too tied into your old one. Adobe Photoshop Pro is Photoshop's professional version, and it costs around \$350 USD. The upcoming Photoshop CC is free, but it is no less powerful than the full version and requires Adobe Creative Cloud to use. Figure 2-1 shows a bitmap image of an aeroplane converted into a vector illustration using Illustrator. **Figure 2-1:** This is an example of a vector image. Presenting Vector Images In Illustrator, vector images are made up of individual paths (short for paths that define curves or shape) that are connected at specific points. Each path contains a change in direction and the distance between points. This makes the vector image flexible because the path can be made smaller or larger, as needed, to achieve a desired effect or application without losing its integrity. In the following sections, I point out the important differences between bitmaps and vectors, explain how the different versions of Photoshop support them, and describe how you can prepare your images for opening in the program. Comparing bitmap and vector images Bitmaps and vector images both have advantages and disadvantages. A bitmap is a simple pixel-by-pixel picture where you can control the resolution (for example, 300 pixels wide and 300 pixels tall) and location (for example, "up" or "left"). Vector images consist of paths that often are based on one another. They're more flexible than bitmaps and can be scaled at any size without losing quality. However, the paths may become complex when large or small at any number of points. Because of the differences in bitmaps and vectors, you must take great care in planning your illustrations. If you do a bitmap, use a resolution that is small enough to provide all the information you need but large enough to support an intent. If you do a vector, plan the size of the paths so that they can be scaled at any size without losing quality or integrity. The figure uses an aerial view of an airport. This image is a bitmap image composed of pixels. The resolution is 150 dpi (that is, dots per inch) for the entire image. The image can be cropped or enlarged up to the point that the detail can no longer be clearly seen. 1. Create a new document that's 300 dpi. A 300 dpi standard

Attentional bias for social threat in social anxiety disorder. Social anxiety disorder (SAD) is characterized by poor attentional bias for social threat and by avoidance of social interactions. Interpersonal tasks are often avoided in SAD because of fear of negative evaluations from others. However, performance on such tasks is low in SAD due to avoidance rather than fear per se. Attentional bias for social threat in SAD is incompletely understood. Social-cognitive research in SAD suggests a fear of negative evaluation (i.e., socially feared interpretation [SFI] hypothesis). In Experiment 1, 60 participants with SAD and 60 healthy participants completed a dot-probe task with facial expressions (positive, neutral, or negative) and an array of emotional words (pleasant, unpleasant, or neutral) as stimuli. The SAD group demonstrated a small attentional bias for words and faces expressing negative emotions, but no avoidance of positive words and faces. Experiment 2 replicated the finding that a fear of negative evaluation (i.e., SFI hypothesis) could account for the pattern of attentional bias. Experiment 3 further investigated whether response latency in a task-related preparation time before stimulus presentation would predict attentional bias in a dot-probe task. Slow RTs for socially negative stimuli predicted attentional avoidance of socially negative facial expressions and words. We concluded that (a) SAD is characterized by an attentional bias for socially negative stimuli, (b) a fear of negative evaluation is a necessary condition for this pattern of attention, and (c) slower reaction time for socially negative stimuli predicts attentional avoidance of social threat.Q: Why non-integer month can be retrieved properly in mysql? I have an application and two queries that work properly. It is two statement, which are functionally identical and do the same thing. The only difference is that they use different statements.
